CLISBee-S – FAST RUNNING LINES

NET & NED offer innovative line scan cameras.

The CLISBee-S camera series is designed by Nippon Electro-Sensory Devices Corporation (NED), a manufacturer of high quality line scan cameras for industrial machine vision systems. CLISBee-S cameras achieve resolutions of up to 16384 pixel per row and a line scan rate of up to 125 kHz (at 2048 pixel per row). The cameras are available with CCD and CMOS

linear image sensors delivering optimal results for monochrome and color line inspections. CLISBee-S applies the prism-based 3K-chip technology which enables customers to inspect also non-flat objects in regard of color without any optical alignment and synchronization topics. The cameras are offered with Camera Link, GigE Vision and CoaXPress interface. As a result CLISBee-S is suitable for virtually any line

scan application, which depends on highest quality image data, involves remote distances over 100 m, or requires data transfer rates of up to 6.25 Gb/s. Due to the image sensors' high photosensitivity, an excellent signal-to-noise ratio, and camera functions that really improve the image result, like anti blooming and flatfield correction, CLISBee-S delivers optimal results to inspection systems.

THE RIGHT APPROACH FOR EVERY INSPECTION SYSTEM

Line scan cameras allow high-speed 100% inspection of wide fields of view at comparably low setup costs. As there is no line scan camera being a perfect fit for every inspection system, NET offers cameras with different features that meet most different demands.

MONOCHROME LINES

- Single line is usually referred to as standard line scan type. This sensor type is considered when low to medium sensor sensitivity is required for customers' applications. If this applies - even for high line rates and small pixel sizes - then a simple optical setup will do, and the overall system costs are very low.
- Dual/multi line sensors have a multiple sensitivity of a single line sensor and also dispose of exposure control. This allows to address inspection tasks with more detailed images.
- Time Delay Integration (TDI) comes typically with CCD image sensors because no extra read noise is introduced to the image. Although TDI employs the same principle as dual line, it offers superior sensitivity due to the inclusion of actually several hundreds lines. Certainly, the exact optical configuration requires special expertise.

COLOR LINES

- Monoline color stands for single-line sensors with a color filter in an R-G-B-R-G-B sequence. Customers profit from a low cost solution with no color lag and an easy optical setup.
- Dual line with Bayern Pattern adds a second line of green pixels for improved color information as one pixel consists of either blue and green or red and green values, and a third interpolated color.
- 3-line color sensors distribute each color (red, green, blue) on a single pixel line for a better color reproduction.
- In the case of 3-CCD or 3-CMOS color sensors the light is split into red, green and blue by using a prism. Then a separate sensor is applied for each color reproduction. This method leads to best color results currently available. Non-flat objects or a diagonal camera angle are no issue for this kind of line scan cameras.

APPLICATION & ACCESSORIES

Ask us for matching lenses & illumination!

APPLICATION EXAMPLES

CLISBee-S line scan cameras have been developed for use in many different image processing tasks in various industries. They can be used in inspection systems for paper machines, film extruders, coating and paint finishing machines or even in the production of non-woven fabrics. High-resolution systems can be applied for 100% print defect detection in the printing of labels not only in pharmaceutical printing, but also in the production of bond paper.

web inspection

Typical applications are web inspection, paper inspection, film and foil inspection, textile / non-woven or pre bag inspection, coating process, solar and glass inspection, print inspection.

KEY FEATURES

- Up to 125 kHz line scan rate
- Sensor range 2048 pixel up to 16384 pixel
- Latest CMOS and CCD linear image sensor featuring high sensitivity, low noise and an excellent S/N ratio
- Onboard A/D converter
- Flat field correction
- Test pattern output
- Scan direction change
- Exposure control
- Selectable region of interest

LENSES AND LIGHT

NET provides the line scan illumination technology most suited to your application ranging from a low-budget version of the aperture tube – complete with line scan aperture and lens mount and a fully usable line illumination – to high-tech LED light sensors with the most up-to-date onboard technology. Special line scan lenses for high resolution, high contrast and low distortion are available with C-mount, F-mount, or M72-mount.
